

**Mumba Cloud is a mobile app for business. It consists of various modules that are easily customised for specific business purposes.**

For example, our modules can be configured to provide executives easy access to reports or for employees to access their payslips. Another module could be customised for specific processes allowing staff to submit Leave requests or for managers to approve On-boarding applications. Modules might even be configured to communicate important company news and policies directly to every employee's phone.

The key benefit from an **end user perspective**, is that all these modules are contained in a single app with the same look and feel interface, making it extremely easy for employees to use without any training.

From a **business perspective**, Mumba Cloud is rapidly customised to solve important issues related to access, business processes and communication within a short timeframe and at a very attractive cost.

The best part of Mumba Cloud from an **IT perspective** is that the app is implemented, managed and maintained by our expert team. Mumba Cloud complies with the highest standards of enterprise security with all data stored within Australian sovereign borders. All hosting, maintenance, security updates and support is included in our service – all backed by our Enterprise SLA.
